

Class 2

April 13, 2026

Production Game

Moving on!

Production Game

We are not monopolists! It is not a one-shot game!

- **Do not use monopoly pricing – that was only for the production and trading games.**
- **Daily production is no longer given at 40/day**
- Leadtime is no longer 3.5 days
- Production cost is no longer \$100
- You will have to pay for shipping
- You will have to pay for overhead
- Retailers will have to pay handling fees
- Retailers will have to pay 20% commissions to DC salespeople.
- Put yesterday behind you – we are no longer monopolists.

Set-up

- Bench factory
 - \$100,000 land, \$100,000 capital investment, \$2,500/day in recurring labor costs
- Heart View product
- Design new goods
 - Gleacher Game Market Research for Production Game (PDF) and Product Design Guide (Excel)
 - R&D days and cost, materials cost
 - Consider willingness to pay
- Manage your factory
 - Recurring costs
 - Batch sizes
 - Priorities
 - Production function
- **We will not build new factories until Tuesday**
- You will have plenty of cash to design products today

Production Game

Play

- Start at the end of quarter 4 (day 365).
- Play 1 hour in class to the end of quarter 6 (day 546).
- Play 2 hours this evening to the end of quarter 10 (day 910).
- We'll play the game without you to day 1092, to see what would have happened.
- Speed: 3 game days per minute.
- You may want to work on homework concurrently, so that you connect the homework to the activities in the game. That's not a requirement, just a suggestion. At a minimum, please review the assignment questions before you play tonight.
- Catherine and Kathleen will not be playing tonight so they cannot trade with you.

Production Game Map

Please pay attention to envelopes!

Starting Point

Goal now: Maximize Current Shareholder Value

Integrated Strategic Management

Creating Value in Complex
and Ambiguous Settings

Factories (production)

Manage Your Factory

Production Model: Cobb Douglas

Questions

- How many units can our factory produce in 1 day?
- How many units are in a batch of inventory?
- How long does it take to produce a batch of inventory?
- What does it cost us to produce a batch of inventory?
- What is the manufacturing overhead cost for each unit produced?
- What determines the answers to these questions?

Steps

- Use the Cobb Douglas production function to solve for daily production (throughput)
- Use Little's Law to get cycle time (CT)
- Add set up time to get CT with set up time
- Use Little's Law to get daily throughput adjusted for set up time

Cobb Douglas Production Function

$$Y = AK^{\alpha}L^{\beta}$$

Where:

- Y is the quantity produced over the year
- A is total factory productivity
- K is the units of capital employed (the capital invested in your factory)
- L is the daily recurring costs * 364
- α is the coefficient on capital
- β is the coefficient on labor

Current Technology and Inputs:

- Batch size = 100 units
- Daily recurring costs (labor) = \$2,500
- Factory cost (capital) = \$100,000
- $A = 0.009$
- $\alpha = 0.10$
- $\beta = 0.85$
- Setup time = 0.05 days

What is our daily throughput?

Little's Law

Little's law states that the average number of items within a system (inventory) is equal to the average arrival rate of items into and out of the system (throughput) multiplied by the average amount of time an item spends in the system:

$$INV = \lambda * CT$$

INV = inventory, number of jobs in the system

λ = throughput, rate at which jobs pass through the system

CT = cycle time, the time a job remains in a system

Notes and Calculations

Notes and Calculations

All Factories

Technology	A	α	β	Technology Description
Benches	0.009	0.10	0.85	Lab benches with general-purpose equipment. Each table is manned by a skilled worker who produces an entire product. Setup time for new batches = 0.05 days
Production Line	0.010	0.30	0.75	A row of tables with specialized equipment and each worker assigned a specific portion of the production sequence. Workers are relatively unskilled. Setup time for new batches = 0.50 days
Automated Cell	0.020	0.80	0.30	A robot that feeds material to automated production machines clustered around it. There is support staff but no workers performing actual production. Setup time for new batches = 1 day

Contribution Margin for Heart View

Example

Contribution Margin = Price – Variable Costs = P – VC

Price = \$700

Variable costs:

- Direct materials (\$100)
- Manufacturing overhead (use what we calculated earlier)
- Shipping (to DC)
- Sales commission (20% of sales price)
- Handling (\$10 per unit)
- Taxes (35%)

Contribution Margin for Heart View

Contribution Margin = Price – Variable Cost = P – VC

Variable Cost = Manufacturing Overhead + Materials + Shipping to DC + Handling + Commission

	Per Unit
Revenue	
Manufacturing Overhead	
Materials	
Shipping	
Handling (\$10 per unit)	
Commission (20% of revenue)	
Contribution Margin before Tax	
Tax (35% tax rate)	
Contribution Margin after Tax	

Break-even Point

Heart View

Break-even point = Fixed Costs/Contribution Margin

Fixed costs = Distribution Center Operating Expense + Distribution Center Depreciation

	\$ Quarter 4
Sales revenue	\$ 682,500
Cost of goods sold	\$ 417,743
Gross profit	\$ 264,757
Selling expense	\$ 146,250
Distribution center operating expense	\$ 182,000
Total selling expense	\$ 328,250
Distribution center depreciation expense	\$ 41,667
Idle factory expense	\$ 0
Other operating expenses	\$ 41,667
Operating income	\$ (105,160)
Interest revenue	\$ 11,913
Net interest and fees revenue (expense)	\$ 11,913
Total net income before tax	\$ (93,247)
Income tax expense	\$ (32,636)
Net income after tax and before extraordinary items	\$ (60,611)
Net income	\$ (60,611)

 - Low budget research
 - Broad, not precise
- Focus Groups
 - \$20,000 per focus group
 - 10 participants per group
 - Summary metrics: Max, Med
 - All WTP included

Market Overview

More markets will open in future games

Market Overviews

Clinical

The clinical market segments are similar to the medical segments described below, except that a clinician would provide the monitor to a patient, but the patient, instead of a physician, would have primary responsibility for monitoring the data. There are two clinical market segments: cardiovascular and fertility.

Law

For these markets, a court order would require an offender to wear the monitor, continually transmitting toxicology and location data to law enforcement, generally over the course of several days or weeks. Police departments and other government organizations would purchase the monitors to measure alcohol or different families of drugs in the bloodstream of individuals, mostly parolees. These markets are made up of six independent segments. In each segment, the agencies care about a different type of toxicology monitoring, but they all care about tracking the location of the monitored individuals, and the ability to receive continuous data updates over a cellular network, as opposed to Bluetooth, connection (with rough equivalence between the 2.4 GHz and 5 GHz options).

Medical

These markets consist of physicians monitoring patients who are undergoing various therapies. There are 14 independent market segments made up of different medical practices. A department or physician would purchase a monitor appropriate for their specific practice, provide it to a patient as part of that patient's treatment, and then review the collected data online. Selling a monitor to one segment would have no effect on the consumers in the other medical segments.

Feature Descriptions

All product designs need these 5 features (GPS can be “No GPS”)

Feature Descriptions

Platform

The electronics and monitors are added to a wearable “platform” that keeps the monitors close to the skin. People that wear the monitors prefer smaller monitors (wrist bands) over larger monitors that would typically be worn under clothes. Some markets (e.g., general population, fashion-conscious consumers) have a stronger preference for this than others.

GPS

Adding a GPS to monitors allows the monitor results to be correlated with location. This feature is imperative for some markets (e.g., law enforcement), and nice-to-have for others.

Network

To be useful the monitor must be able to transmit data for storage on another device like a smartphone or a device on the cloud. Bluetooth transmits data to a smartphone or other hand-held device. The 2.4 GHz and 5 GHz interfaces allow the monitor to transmit data over cellular networks. As with GPS, this is a very important requirement for certain markets.

Power

The monitor must have power to work, and it is designed to run on a rechargeable battery. The nickel cadmium (Ni-Cd) battery is small but basic; it can only last a few hours on full charge. The polymer battery, while of similar size to the Ni-Cd, is lighter and can last several days on one charge. The two battery pack power options simply combine multiple batteries (of either the nickel cadmium or polymer variety, depending on the type of pack) into an arrangement that is wearable around the waist, which while rather bulky and heavy for the casual user, has the merit of increasing the time between charges by a factor of about ten.

Finish

The original monitor encapsulates the hardware in utilitarian plastic, which is functional, but not particularly appealing. The monitor could be encapsulated in dyed or painted plastic, with matching materials for the platform garment. Current customers have not requested new finishes but the sales representatives hope that a more fashionable looking monitor might drive downstream demand, particularly in athletic markets.

Market Research Report for Production Game

MD Heart Market

MD Heart Market

This market is comprised mainly of cardiovascular physicians who provide monitors to patients concerned with heart disease. The temporal monitor might be a convenient replacement for on-site evaluations that cost \$250-\$500.

Regional Market Size

Region	Market Size
Each Region	20,000-40,000

Bass Model Parameters

Parameter	Value
p	0.0002
incremental p from every \$500 in daily advertising	0.0002
q	0.0035

Note: incremental p from advertising only applies to the product on which it is spent, in the distribution center where it is spent, and on the day that it is spent.

Willingness to Pay (WTP)

Core Feature (Heartbeat)	WTP
Pulse only	0-115
Temporal	600-865

Note: These WTP values assume products that contain a reasonable set of features beyond one of the core features listed in the table.

Deal Breakers

- While not a complete deal breaker for all customers, lack of GPS can significantly drive down the perceived value of the product, since it's seen as a safety mechanism for dealing with patients who might experience an acute cardiovascular episode.

Other Considerations

- Minor considerations such as the convenience of various power configurations and the appeal of upgraded product finishes may also affect WTP.
- Average Days Sales Outstanding (DSO) = 30.

Market Research Report for Production Game

Clinical Fertility Market

Clinical Fertility Market

The fertility B2C market is made up of women who are interested in continually monitoring their fertility cycles. They currently can buy a device that will monitor their Reproductive LH at a cost of \$50-\$150. Your company is capable of creating a more convenient version of this device, as well as a combined LH / FSH device that will increase the monitor's precision.

Regional Market Size

Region	Market Size
Each Region	40,000-60,000

Bass Model Parameters

Parameter	Value
p	0.00025
incremental p from every \$500 in daily advertising	0.00025
q	0.004

Note: incremental p from advertising only applies to the product on which it is spent, in the distribution center where it is spent, and on the day that it is spent.

Willingness to Pay (WTP)

Core Feature (Hormone)	WTP
LH	130-300
LH / FSH	230-400

Note: These WTP values assume products that contain a reasonable set of features beyond one of the core features listed in the table.

Deal Breakers

- The discomfort of wearing bulky battery packs.

Other Considerations

- The end users in this market have a slight preference for wearing devices on their wrists and rather dislike wearing them around their chests.
- Minor considerations regarding GPS connectivity and upgraded product finishes may also affect WTP.
- Average Days Sales Outstanding (DSO) = 10.

Questions to think about

- What should we charge our retail customers?
- What should we charge our wholesale customers?
- How many customers do we expect per day?
- How big should our batch sizes be?
- How much labor do we put in our factory on a daily basis?
- How big should our factory be?
- How many can we produce per day?
- Do we have excess capacity?
- How should we ship our goods?
- How long does it take for our wholesalers to receive our goods?
- How long does it take for us to receive our goods?
- What terms should we give our wholesalers?
- How do we manage our company?
- Who does what?
- Other?

Things to Consider

- Market sizes are the same in all regions, with the exception of Metropolis
- Willingness to pay is the same in all regions
- You can trade with all teams
- You can change your batch sizes
- You can speed up or slow down your factory
 - Through CAPEX
 - Through Daily Expenditure
- You can use containers or mail for shipping
 - Consider time
 - Consider how many units you need in a container to equal the per unit mailing cost
- You can ship to wholesale customers from the factory or from your DC
- You can only sell to retail customers through the DCs

**Use the Quick Reference
Guide on Canvas!**

Things to Remember

Seriously, read these!

- You can build new factories.
- You can build new distribution centers.
- Set up shipping agreements at the same time you start construction on factories and DCs, and at the same you start development of new products.
- Name your factories and products in a way that makes them easy to identify.
- You can speed up or slow down your factory. Never set labor to a very low amount. Set it either to 0 to shut down the factory or to something reasonable for production. Only add incremental capital to a factory.
- Understand why factories go idle and what to do about it. Understand why you stock out and what to do about it. Watch your inventory status report to identify service interruptions and build up of inventory.
- Make sure the products you design or purchase include the features you think they do.
- Make sure you run focus groups for the correct markets.
- Don't sell things for less than what they cost you to produce.
- You can trade with anyone. Agree on terms through chat or in person before sending shipping agreements.
- When sending shipping agreements to other teams, include some WTP information in the comment section to cut down on negotiation time.
- Remember that if you find a market in your region, the same market, WTP and market size exists in all other regions.
- Don't forget that the commission and handling charges are paid by the retailer and shipping is paid by the wholesaler. Incorporate that information in your offers.
- You can use containers or mail for shipping.
- You can ship to wholesale customers from your DC or your factory.
- You can only sell to retail customers through the DCs.
- Make sure you understand how priorities and reorder points work. Make your reorder points > 0 for active shipping agreements. To suspend a shipping agreement, put the re-order point at -1 .

Things to Remember

Seriously, read these!

- Use the scheduling features to shut down factories, start and stop advertising, schedule construction projects, start development, among other things.
- Review your financials frequently to catch problems.
- Make sure the left hand knows what the right hand is doing.
- Choose strategic partners wisely.
- Do not use outdated course materials; only use those for today.
- Use the Quick Reference guide.
- Use the Player Manual.
- Use the reports.
- Use your models. We made them for a reason.
- Watch the chat panel as we put tips and answer questions there, and other teams may be trying to contact you.

Goal

SUPPLY = DEMAND

Integrated Strategic Management

Creating Value in Complex
and Ambiguous Settings
